**(54) LIQUID CRYSTAL
DISPLAY DEVICE**

(57) Abstract:

PROBLEM TO BE SOLVED: To provide a high-performance semitransmission type liquid crystal display device in which both functions of a reflection type device and a transmission type device are improved.

SOLUTION: A phase difference plate 3 and a polarizing plate 4 are successively stacked on a liquid crystal panel 2, and a phase difference plate 5, a polarizing plate 6 and a back light 7 are successively stacked on the other face of the panel. In the liquid crystal panel 2, an electrode 10 and an alignment film 11 are successively formed on a glass substrate 8, while a color filter 12, an overcoat layer 13, a transparent electrode 14 and an alignment film 15 are formed on a glass substrate 9. The glass substrates 8, 9 are laminated through a liquid crystal layer 16. The electrode 10 is composed of a

transparent conductive part 10a and a light-shielding part 10b. The color filter 12 is formed by arranging a color filter 12a having spectral characteristics corresponding to the transparent conductive part 10a and a color filter 12b having spectral characteristics corresponding to the light-shielding part 10b.
